

Air Bubble Detector

Type SONOCHECK ABD05.100

Suitable for medical applications.

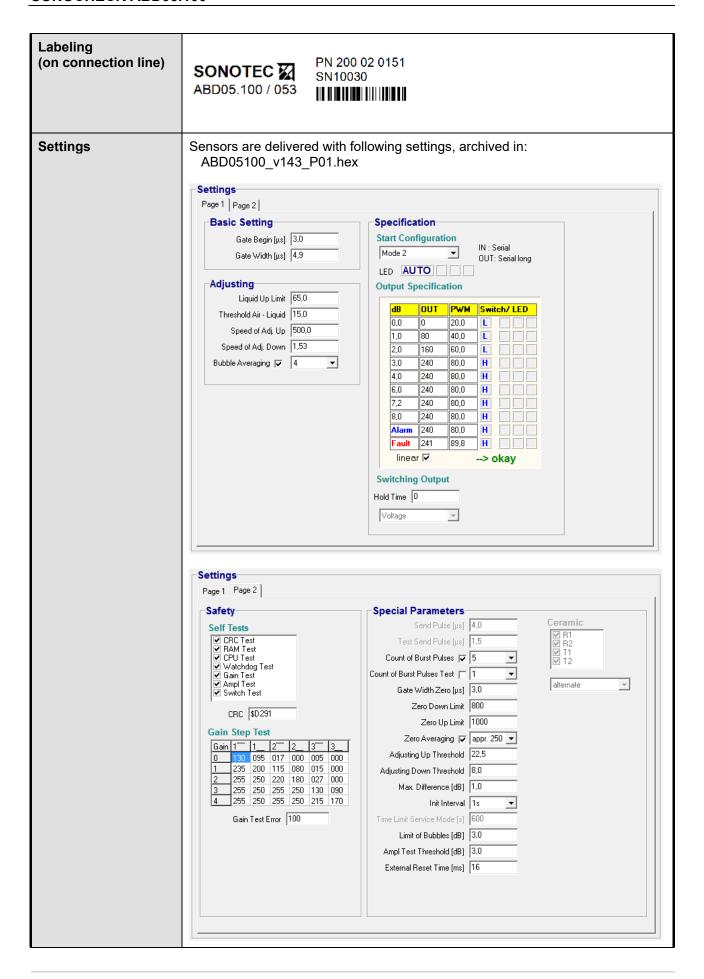

Technical Data

SONOCHECK type ABD05.100					
	Air Bubble Detector				
Measuring method	Ultrasound				
Sensor types	Sensor Type	SONOTEC Order No.			
	SONOCHECK ABD05.100	200 02 0138			
Bubble sensitivity	Configured to high bubble sensitivity, threshold 3.0 dB				
	Reliable detection of Bubbles ≥ 12 µl (worst case)				
	Test Condition: Plastic tubing, PVC, OD 6.8 mm and ID 4.3 mm, water, full inserted				
	Note: Bubble sensitivity is depending from mounting position on tubing. The most sensitive position is side upwards. The worst sensitive position is bottom side up. The exact characteristics will be evaluated with samples later.				
Tubing	Plastic, PVC, OD 6.8 mm and ID 4.3 mm				
	Other similar tubing or materials are possible.				
	Pay attention: The guaranteed bubble sensitivity (see above) depends on the kind of tubing. It is in responsibility of customer to proof the suitability in combination with the machine and the used safety concept.				
Measuring cycle	200 μs				
Response time	< 2 ms (AIR to LIQUID and vice versa)				
Holding time	No holding time (other on request)				
Operating temperature	+15 °C to +50 °C				
Storage temperature	-20 °C to +70 °C				
Materials / Housing	Housing: ABS, black				
	Sensor is backside potted with PU	R, blue			
Mounting	2 x threads with steel insert UTS #4-40 on back side				

Requirements for liquid	Low-viscosity liquids, like human blood or saline				
Protection	IP67 (potted)				
Operating voltage	+5 ± 0.5 VDC / max. 50 mA				
Current consumption	Pay Attention:				
	 No protection against reverse polarity integrated into the sensor. Power supply must be protected against overvoltage > 5.5 V. Power supply must be limited to max. current of 200 mA by means of suitable equipment in machine (fuse/ regulator/). 				
Connecting line	Cable: 4 x wires in different colors, 0.14 mm², length 10" ± 0.5" Connector: MOLEX Series SL (50-57-9404), 4 pins, female				
Inputs and outputs	Connection	Specification	Pin Connector	Color	
	Operating voltage	+5 ± 0.5 VDC	1	red	
	Ground (GND)	Ground	2	blue	
	Тх	Output, 5V logic, TTL, max. 8 mA	3	white	
	Rx	Input, 5V logic, TTL	4	yellow	
Interface to machine / Safety	Sensor architecture supports different possibilities to reach a high level of patient safety. The set up of concept of interface is in responsibility of manufacturer of medical device. The aim of interface concept is to reach a secured data transmission from sensor to machine, to avoid a misinterpreting of signals in case of e.g. broken				
	wires/ short circuit between wires, power-off, crashed SW				
Serial interface	Sensor operates in Mode 2				
	Principle: Safe interface by secured serial data transmission				
	Tx, Output Configured as serial output, 115.200 kBaud. Sensor transmits cyclically frames within time interval of 1 ms. Mode 2: Frame of 5 bytes, data to bubble alarm/ device fault/ sequence counter/ sampled service data/ secured by CRC Note: For detailed information see Specification of Serial Interface				
		SONOCHECK			
		Configured as serial input,115.200 kBaud, used for service and for controlling (Bubble Test / Restart)			
Start procedure	After power on or on restart the init interval is started. Inside this period the sensors acts to commands of serial interface.				
Initial interval / Initial test	After init interval the initial test will be performed. This includes test routines for the Tx output. Level on output will be changed several times.				
	Both, init interval and initial test, takes approx. 1.1 1.3 s, at least 1 s.				

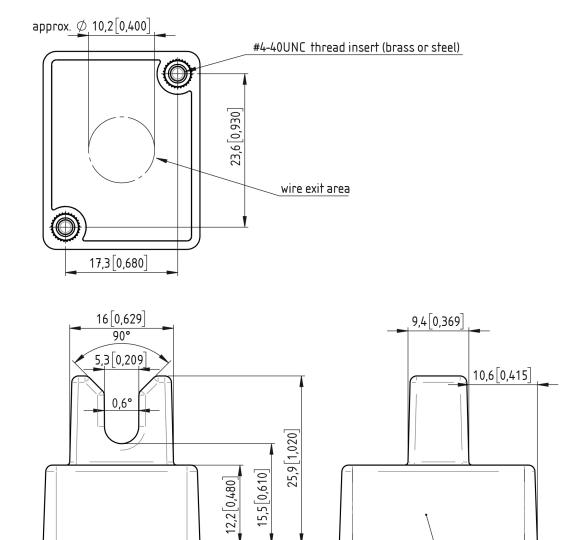

Safety	Fail-Safe-Architecture, one channel		
	Pay Attention:		
	Sensor must be tested completely in periods of max. 24 h. That means, Initial Test must be performed at least once in 24 h.		
	Power cycling or serial commands can be used to initiate a restart. Subsequent the Initial Test is performed, including test routines for outlet.		
Service option	The sensor is configured for serial communication and acts to commands. Such a way the boot loader could be reached and settings of sensor can be changed or verified. The ABD Monitor in combination with USB Data Converter Type 007 supports setting operating and the required time management.		
Configuration (optional)	ABD Monitor Using computer software ABD Monitor you can observe the behavior of sensor and the reaction of varied level. For debugging or archiving you can export data into Excel or Text files.		
	Even configuration can be adjusted to special conditions of application. Please ask our staff for detailed information.		
Connection to USB Data Converter	USB Data Converter Type 007 For service and diagnostics the sensor should be connected via USB Data Converter to a free USB port of the computer. USB device has to be installed according provided installation routine. The sensor is powered directly via USB. blue yellow white red USB Data Converter Type 007 USB Data Converter Type 007 SIGNAL USB Data Converter Type 007 POWER		
Revisions	ABD05.100, HW V1.0 / SW ABD05100_V01.43.05.00 / Settings P01		
Directives / Standards	 EMC complying with EN 60601-1-2:2016 (4th edition) Safety requirements from IEC 60601-1:2005 (3rd edition) Acoustic output of medical diagnostic ultrasonic equipment complying with EN 61157:2007 Failsafe in compliance with EN 60601 SONOTEC is certified according to ISO 9001 and EN ISO 13485
