

Nondestructive Testing

The most common method for nondestructive material testing is ultrasonic testing, especially ultrasonic weld seam testing. This standard ultrasound inspection detects invisible cracks, inclusions, cavities and discontinuities quickly and reliably.

Ultrasonic wall thickness measurement as part of non-destructive testing is one of the most common methods of ultrasonic technologies. In addition to the classic measurement of wall thickness as part of quality control, our precise wall thickness measurement devices can also be used to detect failures caused by erosion and corrosion on ships, storage tanks, pipelines as well as machines and components.
